

Claims: I claim:

1. A latch to secure a detachable sponge to a sponge mop head comprising:
  - a. a pair of opposed tabs separated by a void, the upper and lower portions of each pair spaced to fit closely within corresponding apertures in the mop head,
  - b. the central portion ramping outward such that the dimension between the opposed tab ramps is larger than the aperture opening,
  - c. Each tab being more or less centrally located on a beam, the beam extending a short distance beyond either end of the tab until it interconnects with a sponge backing plate.
  - d. this short section of beam beyond each end of each tab twisting or rotating torsionally when the tabs are squeezed together to secure or detach the sponge to the mop head.
